Contents:

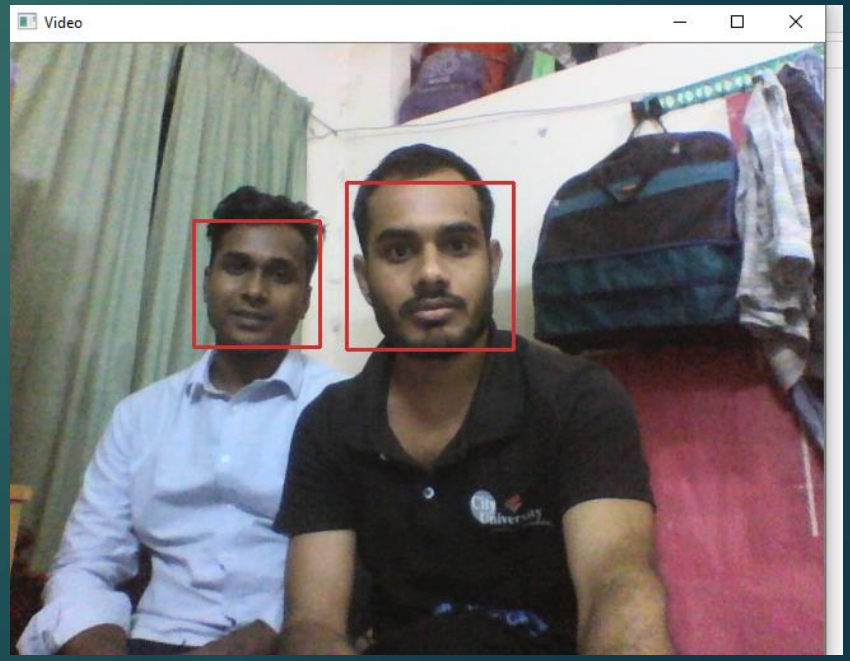
- • Objectives
- •What is Face Detection?
- •Face detection and Recognition
- •Why we chose Face Detection Project?
- •Methodology
- •Limitation
- •Future Plan

Objectives

- The objective of our project is to design software that can detect human faces on real time.

What is Face Detection?

- Face detection is a computer technology being used in a variety of applications that identifies human faces in digital images.
- It detects facial features and ignores anything else, such as buildings, trees and bodies.



Face detection and Recognition

- Face detection is a broader term than face recognition.
- Face detection just means that a system is able to identify that there is a human face present in an image or video or real time.
- Face detection has several applications, only one of which is facial recognition.

Why we chose Face Detection Project?

- • Compatible with Modern Era.
- • Not common in JAVA.
- • Basic programme for Recognition(Recognition is not possible without Detection).
- • Security Maintenance.

Methodology

Requirement tools:

- OpenCV
- Python IDLE
- Laptop(with web cam)

Methodology

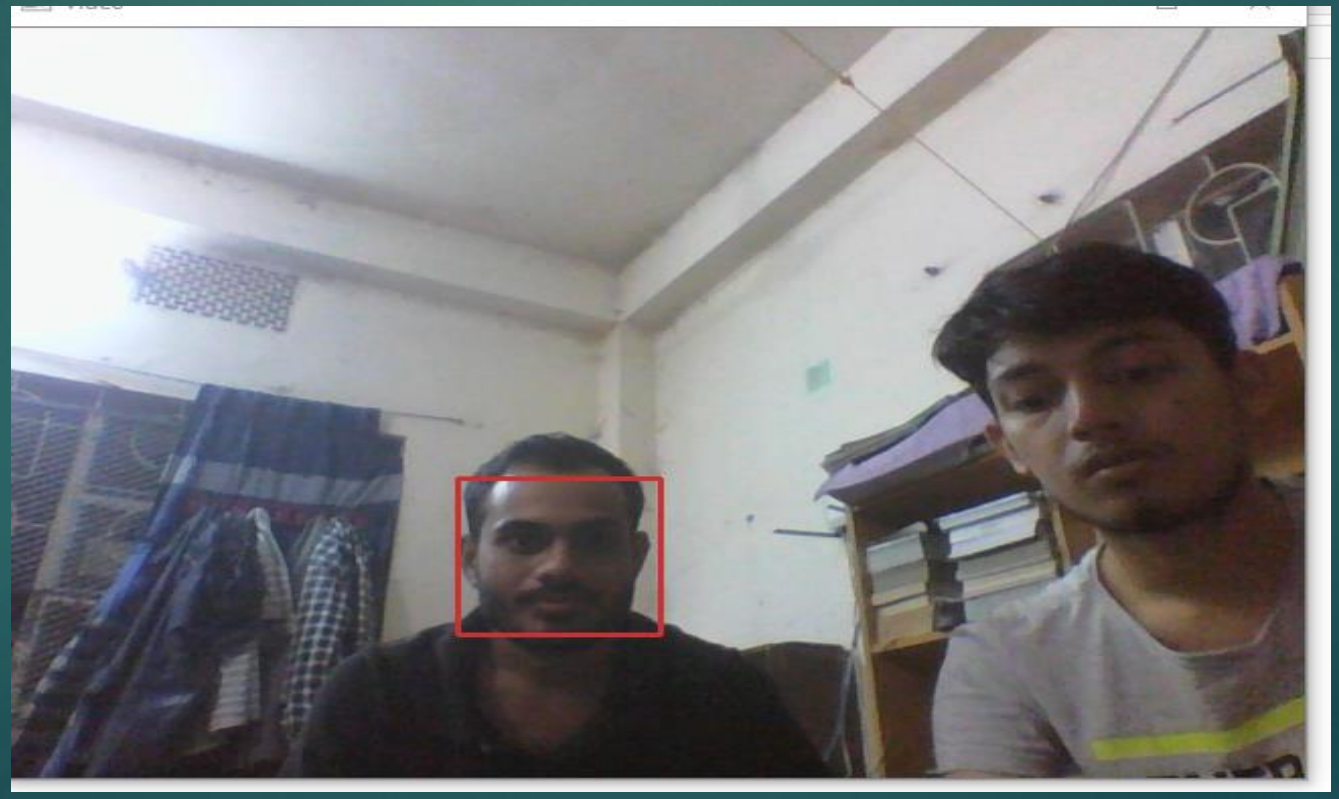
Face detection is performed by using classfiers. A classfier is essentially an algorithm that decides whether a given image is positive(face) or negative(not a face). A classier needs to be trained on thousands of images with and without faces.

Fortunately, OpenCV already have pre-trained face detection classfiers, which can be used in our program.
The two classfiers are:
Haar*cascade* Classfier and
Local Binary Pattern(LBP) classfier.

In our project, we use the *haarcascade* Classfier.

Limitation

- Our project cannot detect the faces accurately in low light.



Future Plan

- Our project can only detect the faces.Not find out the matched faces that stored in the dataset. So we will try to do that in future like this image.
